

and interviews, 500 students and 50 teachers from a university were investigated. The study found that the current blended teaching has problems such as low resource integration and lagging interactive feedback. Based on this, an optimization strategy of "data-driven + precision teaching" is proposed. The results show that the optimized mode significantly improves students' learning engagement and autonomous learning ability. The conclusion is that digital transformation should focus on the reconstruction of teaching processes and the diversification of evaluation systems to achieve continuous improvement in teaching quality.
